Use case

Use case name: paying cash check		ID: BI-3	priority: High

Actor: customer

Description:

 the customer need to pay cash check through customer's account in online banking so the customer send request to the bank to know if he can do that service or no

Trigger: the customer need to pay cash check

Precondition:

The customer have account in online banking

Inter the password to login with customer's account

if the customer don't have account he must inter his information and create password to register

Normal course:

1-login / sign up

2-choose what (that service) cash check from main menu

3- the Admin accept the request

4-the Admin check the transaction information

5-input the information about the transaction into the bank application

6-the bank system verification that sufficient money exists in the account to perform the transection

7-if the transection succeeds the customer account is credited and customer's account is debited

Postcondition:

1-The customer account is credited in the system

2-customer's account is debited

3-the customer receive message about the transaction

Exceptions:

1-The application does not recognize the client's password and send error message

2-when the customer choose the service, the system display message (the service no longer available to users)

3-after the transaction succeeds the customer don't receive the message
